Acknowledgments

Firstly, I would like to thank God for guiding me in this journey full of challenges. By His Grace, I am here taking one more step of my life. I can honestly say Ebenezer, “Hitherto hath the Lord helped me.” I would also like to thank my parents, Ricardo and Delza, for being such a strong presence in my life. Thank you for the love, affection and dedication which made of me the man I am today. I dedicate this victory to you both.

I thank you, André, my brother, with whom I have shared a lot of experiences; Jesana, my sister, Tiago, my brother-in-law, and Isabella, my niece, for making my life happier. I want to say thanks to Leyla, my girlfriend, who I met toward the end of this walk, for being such a lovely companion. I would like to thank Ruy, my advisor, for counselling me throughout this work, answering my questions and teaching me many work and life lessons. I would like to thank Eraldo, with whom I interacted quite a bit and learned a lot from, for really helping me with Machine Learning issues and for being a role model for me. Last and not least, I would like to thank Eduardo for his active participation in the annotation process, Carlos, for his joy and good mood, Leandro, for his funny comments, and CNPq, for the scholarship. For you all, my sincere thank you!

Resumo

Fernandes, William Paulo Ducca; Milidiú, Ruy Luiz. **Extração de Citações para o Português**. Rio de Janeiro, 2012. 59p. Dissertação de Mestrado — Departamento de Informática, Pontifícia Universidade Católica do Rio de Janeiro.

A Extração de Citações consiste na identificação de citações de um texto e na associação destas com seus autores. Neste trabalho, apresentamos um sistema de Extração de Citações para Português. A tarefa de Extração de Citações já foi abordada usando diversas técnicas e para diversas línguas. Nossa proposta é diferente dos trabalhos anteriores, pois usamos Aprendizado de Máquina para construir automaticamente regras especializadas ao invés de regras criadas por humanos. Modelos de Aprendizado de Máquina geralmente apresentam forte capacidade de generalização comparados a modelos feitos por humanos. Além disso, nós podemos facilmente adaptar nosso modelo para outras línguas, precisando apenas de uma lista de verbos de citação para uma dada língua. Os sistemas propostos anteriormente provavelmente precisariam de uma adaptação no conjunto de regras de forma a classificar corretamente as citações, o que consumiria tempo. Nós atacamos a tarefa de Extração de Citações usando um modelo para o algoritmo de *Aprendizado de Transformações Guiado por Entropia* e um modelo para o algoritmo do *Perceptron Estruturado*. Com o objetivo de treinar e avaliar o sistema, nós construímos o corpus GLOBOQUOTES com notícias extraídas do portal GLOBO.COM. Adicionamos etiquetas morfossintáticas ao corpus, utilizando um anotador estado da arte. O Perceptron Estruturado baseado no agendamento de tarefas ponderado tem desempenho $F_{\beta=1}$ igual a 76,80%.

Palavras-chave

Aprendizado de Máquina. Processamento de Linguagem Natural.
Extração de Informação. Extração de Citações. Aprendizado de Transformações Guiado por Entropia. Perceptron Estruturado.
Agendamento de Tarefas Ponderado.

Abstract

Fernandes, William Paulo Ducca; Milidiú, Ruy Luiz (advisor). **Quotation Extraction for Portuguese.** Rio de Janeiro, 2012. 59p. MSc Dissertation — Departamento de Informática, Pontifícia Universidade Católica do Rio de Janeiro.

Quotation Extraction consists of identifying quotations from a text and associating them to their authors. In this work, we present a Quotation Extraction system for Portuguese. Quotation Extraction has been previously approached using different techniques and for several languages. Our proposal differs from previous work since we use Machine Learning to automatically build specialized rules instead of human-derived rules. Machine Learning models usually present stronger generalization power compared to human-derived models. In addition, we are able to easily adapt our model to other languages, needing only a list of verbs of speech for a given language. The previously proposed systems would probably need a rule set adaptation to correctly classify the quotations, which would be time consuming. We tackle the Quotation Extraction task using one model for the *Entropy Guided Transformation Learning* algorithm and another one for the *Structured Perceptron* algorithm. In order to train and evaluate the system, we have build the GLOBOQUOTES corpus, with news extracted from the GLOBO.COM portal. We add part-of-speech tags to the corpus using a state-of-the-art tagger. The Structured Perceptron based on weighted interval scheduling obtains an $F_{\beta=1}$ score of 76.80%.

Keywords

Machine Learning. Natural Language Processing. Information Extraction. Quotation Extraction. Entropy Guided Transformation Learning. Structured Perceptron. Weighted Interval Scheduling.
